

Public Puzzle And Math Bounty Radar - 2026-05-30

Status: public-source bounty radar for Lantern !one; no live trading, no account action, no prize claim, and no proof claim.

Purpose: rank public puzzle/math bounty lanes that Lantern can attack in a novel but bounded fashion: local solver loops, RAG-compressed strategy cards, Lean/checkable proof gates, and human review before public submission.

Source Receipts

Source	Current public signal	URL
ARC Prize 2026 overview	`\$2M` total across three tracks; submissions due `2026-11-02`, papers due `2026-11-08`, results `2026-12-04`; open-source solutions required for prize eligibility.	https://arcprize.org/competitions/2026
ARC-AGI-3	`\$850K` total; interactive agents in novel environments; top-score and milestone awards; no internet during evaluation.	https://arcprize.org/competitions/2026/arc-agi-3
ARC-AGI-2	`\$700K` total; static reasoning tasks; target is `85%` private accuracy inside Kaggle limits; no internet during evaluation.	https://arcprize.org/competitions/2026/arc-agi-2
ARC Paper Prize	`\$450K` total for conceptual progress tied to a Kaggle code submission; rubric values universality, theory, completeness, and novelty.	https://arcprize.org/competitions/2026/paper
Clay Millennium Prize Problems	`\$1M` allocated per problem; six remain unsolved after Poincare.	https://www.claymath.org/millennium-problems/
AMS Beal Prize	`\$1M` held by AMS for a proof or counterexample published in a refereed and respected math publication.	https://www.jointmathematicsmeetings.org/prizes-awards/paview.cgi?parent_id=41
ICML 2026 AI for Math / TCS Proving	`\$8K` across tracks; Lean 4 / CSLib theorem proving, deadline `2026-06-15` AoE.	https://www.codabench.org/competitions/16161/

Ranked Collection Lanes

Rank	Lane	Prize ceiling	Lantern fit	Collection status
1	ARC-AGI-3 interactive agent	`\$850K`	Best match for Lantern's local agent/world-model loop: explore, model, plan, act.	Open research lane; build local simulator and reproducible Kaggle agent.
2	ARC Paper Prize paired with ARC-AGI-3/2	`\$450K`	Best near-term publication lane: document a novel solver architecture even before top leaderboard score.	Prepare methods paper only after a real code submission exists.
3	ARC-AGI-2 static puzzle solver	`\$700K`	Good fit for RAG-compressed puzzle transforms, program search, and two-answer output.	Build offline notebook; no API calls at evaluation time.
4	ICML AI for Math / TCS Proving	`\$8K`	Low-payout but high-validation Lean lane; good for proof-kernel discipline and fast feedback.	Urgent if pursued; deadline is close.
5	Beal Prize	`\$1M`	Long-horizon symbolic search and formalization sandbox only.	No cash sprint; requires serious published proof/counterexample.

Rank	Lane	Prize ceiling	Lantern fit	Collection status
6	Clay Millennium problems	`\$1M` each	Long-horizon research moonshot; use as verifier benchmark, not revenue plan.	No collection claim without peer-reviewed breakthrough.

Novel Lantern Attack Shape

1. Build one offline ARC workbench: task loader, visual transform DSL, hypothesis search, self-play perturbations, and two-output submission writer.
2. Route ARC-AGI-3 through a small agent stack: curiosity policy, map memory, action replay, failure compression, and deterministic seed receipts.
3. Route math bounties through proof gates: natural-language conjecture card, Lean/proof assistant scratch, verifier log, and expert-review hold.
4. Keep all bounty work public-safe: no copied book text, no hidden benchmark leakage, no private solution dumping, and no prize claim before official acceptance.
5. Use game-theory/wargame reader data as a strategy reference only: allocate compute to bounded experiments, stop losing branches early, and preserve reproducibility.

Best Immediate Objective

Build the ARC-AGI-3/ARC Paper Prize starter lane first. It has the strongest fit to Lantern's agent identity, the largest practical near-term public puzzle pool, and a credible route to a public demo even before a prize win.

Minimum useful next commit:

- add an `arc-bounty-workbench` folder with task-loader stubs;
- add a receipt format for experiment runs;
- add a no-internet evaluation boundary test;
- add a short paper-outline template tied to actual results.

Boundaries

- This report is not investment, gambling, legal, or prize-submission advice.
- No claim is made that Lantern can win any bounty today.
- Bounty collection requires official contest submission, rules compliance, and acceptance by the prize authority.
- Clay/Beal work must be treated as formal research, not a fast cash lane.
